Description of the exercises you are going to work on are in file Lab2.1.pdf

There are two questions in file Lab2.1.pdf.
- Answering the first question requires working on an existing source code, which can be the source code you improved during last week's lab session. Alternatively, you can work on the source code that we provide for this lab session (i.e., the Java project Lab1-final that is stored under the folder Q1-Source-Code). If you'd like to work on the source code that we provide, you will need to import the Java project Lab1-final to your Eclipse IDE.
- Answering the second question requires creating a Java project from scratch.

About the Source Code:
The source code that we provide for the first question have been created on Eclipse IDE
If you are working on Eclipse IDE, you can simply import the project folder into your Eclipse workspace. If you are working on another IDE, please ask help from your GTAs.
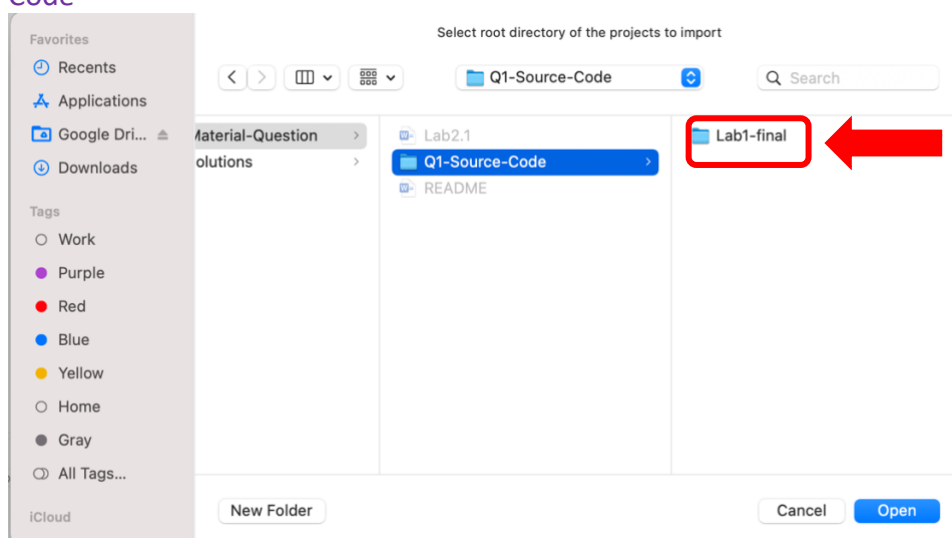

Importing Java Projects to Eclipse IDE:
Open the Eclipse platform and go to **File -> Import**

Select **General -> Existing Projects into Workspace**

Press **Next** and then browse for the Lab1-final folder that is stored under folder Q1-Source-Code

Finally, press **Finish.** Lab1-final you will be working on for this lab session will have been imported in your Eclipse workspace.
